## TECHNICAL DATA SHEET

**RV ANTI-FREEZE (- 40°C)**

This product is a non-toxic, glycol-based anti-freeze for winterizing water lines in recreational vehicles. It is used to protect plumbing from bursting as a result of water expansion during freezing temperatures. This product provides freeze protection to -40°C. It contains a food-grade pink dye to ensure that all water is flushed from the lines during winterization and, inversely, that the glycol is fully flushed in the spring.

**DIRECTIONS:** Consult your RV owner's manual

**Winterization:**

Ensure black water, grey water and hot water tanks are fully drained. Bypass the hot water heater and draw RV anti-freeze into the system through the water pump. Flush toilet and open each hot and cold water tap individually until a constant pink stream runs out. Pour one cup of RV anti-freeze into each drain and 1-2 litres down the toilet into the black water holding tank, in case of standing water.

**Flushing Glycol:**

Restore water pump bypass to normal. Hook up to domestic water supply. Flush toilet and open each hot and cold water tap individually until only clear water comes out without a trace of pink.
