DUST DOWN

This product is a dust suppression additive for water trucks treating temporary roads. It is an emulsified, polymer-based system that rapidly penetrates the surface of the soil, wetting and coalescing underlying fines. This reduces evaporative water loss and run-off from the surface. Below the surface, it binds the fines together, which in turn holds the larger aggregate in place. The result is greatly reduced airborne dust, better surface compaction and less surface deterioration.

ADVANTAGES:

- Does not contain salt ($MgCl_2$, $CaCl_2$ or $NaCl$)
- Does not damage vegetation or equipment
- Petroleum-Free and Lignin-Free
- Does not alter road appearance
- Non-Hazardous, Low Toxicity and User-Friendly
- Hard water tolerant

DIRECTIONS: For initial treatment, use 1 gallon of product for every 100 gallons of water. Apply evenly to the entire road surface with spray equipment.

For subsequent treatments, use 1 gallon of product for every 500 gallons of water.

More or less product may be required depending on soil composition, weather conditions, road usage and other factors.
