AIR LINE ANTIFREEZE

This is a solvent based air line antifreeze. It is designed to prevent air lines from freezing and to thaw frozen lines and pneumatic equipment. This antifreeze will absorb moisture over a broad range of temperatures and pressures. The product is non corrosive, low in toxicity and has a low flammability. This product helps disperse lubricating oil and in addition contains lubricants.

DIRECTIONS: Atomize air line antifreeze into air lines at a rate of 400 ml per 1000 m³ of air. This application was calculated at 0°C and a relative humidity of 60%. Temperature drop and humidity rise would call for slightly increased dosage.

CAUTION: Do not use in air line respirators.
